

We Should save the environment

By Gardening!

Do you have a garden? If you don't you should make one. That's what I want to share with you that you should save the environment by gardening. It's simple but it makes a big difference. I'm going to tell you some problems that will increase... Starvation in every community. Communities that run on natural resources will die out. Diseases will spread all around the world. Soon every animal will be extinct. Many plants are dying because of the conditions of the environment.

If I was the owner of an environment saving organisation I would try to persuade people in the community to find a area to make a community garden. I would ask volunteers to build the garden. It would not only help stop starvation but it will help the volunteers get stronger.

I interviewed Mrs. Biall and she said "the environment was pretty bad when I was a kid. If you caught a fish it was not safe to eat. My family always went on road trips and there was always tons of garbage all around on the street" (Mrs. Biall).

things we can do to help stop those problems... We can make a community garden for food. We can sell the extra crops for charity and starving and poor people. Next we could plant a lot of gardens in each person's yard to have more home made food. Next we could reserve a couple acres of land for animals. Working around the gardens it will help people get stronger and they can eat the healthy food. If you think these solutions are bad you don't have

to do them but you have to stop these problems.

How to build your garden

Now I'm going to tell you how to build your garden. I'm going to show you two different ways to build your garden.

One way to make your garden is a garden bed its small so if your community can find and area to put it that would be great you will need Saw, wood, glue, Dirt, ferteliser, seeds first we cut the wood then we put the wood in a rectangle ^{and glued it} then we put it snug in the ground but you could still see wood so we put dirt in and then a little ferteliser, then we planted the seeds We watered and poof in a couple of weeks things were sprouting if you don't like short a sweat then you should do the next version of gardens I recemend. If you want to make the hard version here it is you us wood, dirt seeds, how, glue, you put the wood in a huge square and glue it then you fill the square with dirt then you water the dirt then you how the ground then you plant the

Seeds and water the
seeds. At the end I want
you to feel the same
way I do that you should make
a community garden and eat
the vegetables. But that's not all I also
feel that you should feel that the environ-
ment is worth saving!
